

Cloud NAT gateway ÷

network
access
translator

Security (Firewall)

traffic entering
inside the machine

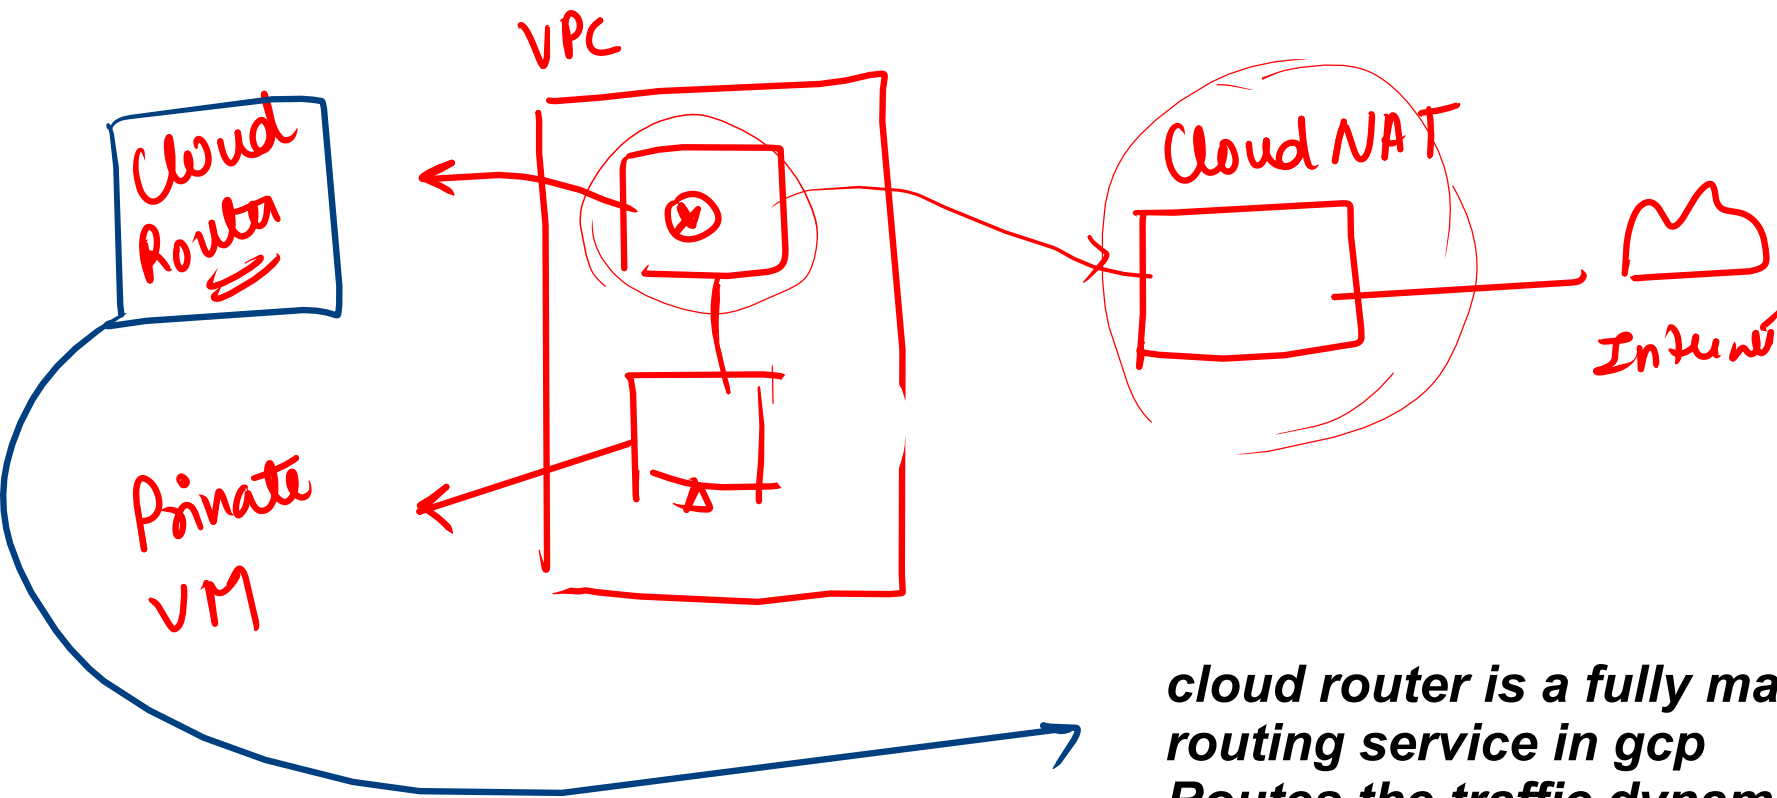

Inbound traffic

Outbound
Traffic

traffic generated from inside the machine

It allows **private VMs** (without external/public IP addresses) to access the Internet for **outbound connection only** - **without exposing them to Inbound traffic from Internet**.

cloud nat allows ur resources to create outbound connections to the internet without giving public ip to them

cloud router is a fully managed , scalable and dynamic routing service in gcp
Routes the traffic dynamically using bgp
